

Yield Curve - form structure of interest rate

✓ same asset class and credit quality

$$\text{current yield} = \frac{\text{Annual Coupon}}{\text{Purchase Price}}$$

YTM = total return

+ apprec., decrepr., + interest on interest

good for VS.

diff. characteristics

short-term ; long-term

Theory short-term $\rightarrow$ Pure $E(\cdot)$

'slope reflect only
 $E(\cdot)$ of future
short term rate'

long-term $\rightarrow$ Liquidity Preference

'LT yield include term
liquidity premium
on top of rate expect'

Maturity $\rightarrow$ Preferred Habitat

'investor prefer maturity
habitat = risk premium
to move them

Factor

① level $\rightarrow$ all maturity move $\approx$, 'parallel'

② slope $\rightarrow$ ST $>$ LT rate

③ curvature $\rightarrow$ MT change most

Drivers ① ST $\rightarrow$ FED fund rate $\sim 80-90\%$ explained
'control short-end'

② LT $\rightarrow$ inflation $E(\cdot)$

drive level factor

$\sim 5\%$ avg. core CPI; $\sim 66\%$

③ Real Macro. Activity

↓
MT

↓
LT via level factor

$$\text{LT yield} = \text{expect component} \\ (\text{future sr rate}) \\ + \\ \text{risk (term) premium} \\ (\text{compensation for} \\ \text{uncertainty})$$

Standard Model → ~~overest.~~ vol risk
vs premium reduction

Bias-correct Model: risk premium → counter
cyclic

MVP: 10y - 3m spread → capture
full year-term
expectation

App

- 1. leading indicator
- 2. benchmark pricing
- 3. portfolio strategy → earn above
avg. bond returns

Liquidity

Ratio	Formula
Current Ratio	$CA \div CL$
Quick Ratio	$(CA - \text{Inventory} - \text{Prepaid}) \div CL$
Cash Ratio	$\text{Cash} \div CL$
Net Working Capital	$CA - CL$

Solvency

Ratio	Formula
Debt-to-Equity	$\text{Total Debt} \div \text{Equity}$
Debt Ratio	$\text{Total Liabilities} \div \text{Total Assets}$
Equity Multiplier	$\text{Total Assets} \div \text{Equity}$
Interest Coverage	$\text{EBIT} \div \text{Interest Expense}$
DSCR	$\text{NOI} \div (\text{Principal} + \text{Interest})$

Profitability

Ratio	Formula
Gross Margin	$\text{Gross Profit} \div \text{Revenue}$
Operating Margin	$\text{EBIT} \div \text{Revenue}$
Net Margin	$\text{Net Income} \div \text{Revenue}$
ROA	$\text{Net Income} \div \text{Avg. Total Assets}$
ROE	$\text{Net Income} \div \text{Equity}$
ROIC	$\text{NOPAT} \div \text{Invested Capital}$
DuPont ROE	$\text{Net Margin} \times \text{Asset Turnover} \times \text{Equity Multiplier}$

Efficiency

Ratio	Formula
Asset Turnover	$\text{Revenue} \div \text{Avg. Total Assets}$
Inventory Turnover	$\text{COGS} \div \text{Avg. Inventory}$

Ratio	Formula
DIO	$365 \div \text{Inventory Turnover}$
AR Turnover	$\text{Revenue} \div \text{Avg. AR}$
DSO	$365 \div \text{AR Turnover}$
AP Turnover	$\text{COGS} \div \text{Avg. AP}$
DPO	$365 \div \text{AP Turnover}$
CCC	$\text{DIO} + \text{DSO} - \text{DPO}$

Market Valuation

Ratio	Formula
EPS	$(\text{Net Income} - \text{Preferred Div.}) \div \text{Shares Outstanding}$
P/E	$\text{Market Price} \div \text{EPS}$
P/B	$\text{Market Price} \div \text{Book Value per Share}$
EV	$\text{Mkt Cap} + \text{Total Debt} - \text{Cash}$
EV/EBITDA	$\text{EV} \div \text{EBITDA}$
Dividend Yield	$\text{DPS} \div \text{Market Price}$
Payout Ratio	$\text{Dividends} \div \text{Net Income}$
